

Generic Branch-Price-and-Cut

A Status Report

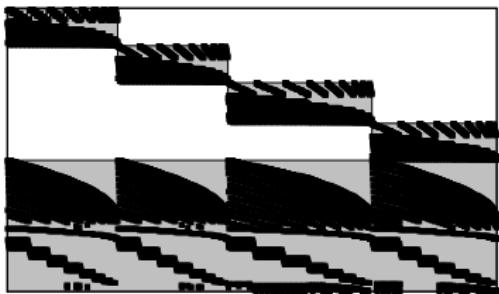

Column Generation · Bromont · June 12, 2012

T-Shirts

can you spot the difference?

Status Quo: On the Positive Side

- ▶ many exciting developments in branch-and-price
- ▶ some problems solvable *only* by B&P
- ▶ more and more experts (look around you!)
- ▶ more and more “standard” in IP solving
- ▶ many successful applications (and growing!)
- ▶ good frameworks for implementation available
- ▶ branch-and-price much easier to implement than years ago

Status Quo: On the Negative Side

- ▶ implementation still non-trivial
- ▶ requires a good deal of work
- ▶ need expert knowledge, experience, and “tricks”

Status Quo: On the Negative Side

- ▶ implementation still non-trivial
- ▶ requires a good deal of work
- ▶ need expert knowledge, experience, and “tricks”
- ▶ many implementations from scratch, little re-use of code
- ▶ implementations not done, because of lack of knowledge
- ▶ implementations not dared, because of unclear outcome
- ▶ many users have no access to a state-of-the-art methodology

Goals of our Project

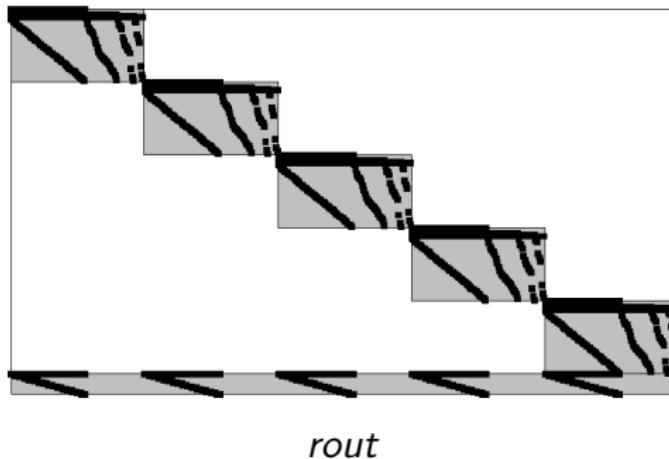

- ▶ we would like to make B&P accessible to a broad audience
- ▶ generic solver for *structured mixed integer programs*
- ▶ fully automatic branch-price-and-cut
- ▶ no user-interaction, usable for non-experts
- ▶ several related/similar projects: BaPCod, DIP, G12
- ▶ report only on our solver: GCG

Our Generic BP&C Solver GCG

- ▶ based on state-of-the-art MIP solver SCIP
- ▶ automatic detection of decomposable structures
- ▶ alternatively: user provides a decomposition
- ▶ DW reformulation, column generation, branch-and-price
- ▶ synchronizes two trees, “original” and “extended” formulation
- ▶ convexification, discretization, aggregation
- ▶ parallelization of subproblems
- ▶ branching on original variables, Ryan/Foster, ...
- ▶ integration of generic (combinatorial) cutting planes
- ▶ primal heuristics particular to decompositions
- ▶ preprocessing, propagation, ... (inherited from SCIP)
- ⋮

Dantzig-Wolfe: Traditional Realm

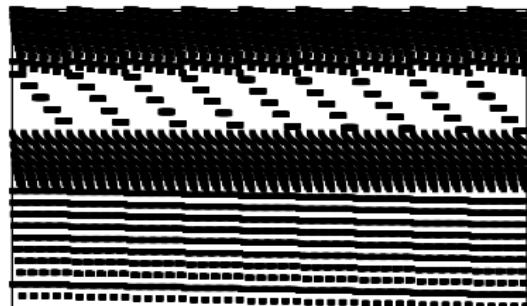

- ▶ Dantzig-Wolfe works particularly well for bordered block-angular matrix structure

- ▶ vehicle routing, generalized assignment, cutting stock, p -median, bin packing, graph coloring, ...

Block-Angular Structure?

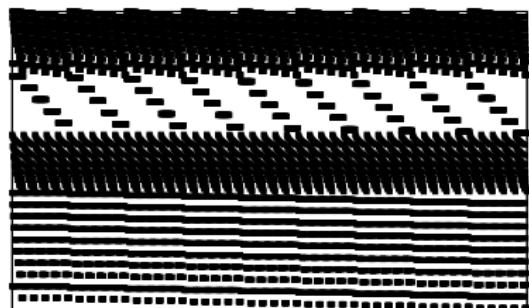

- ▶ key to automatic decomposition: detect “structure”

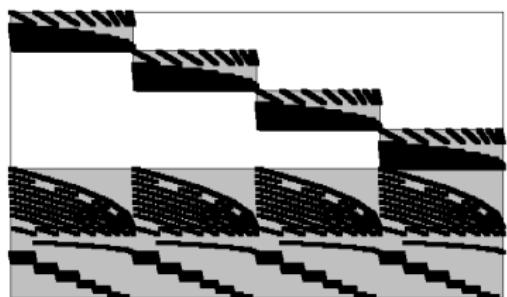

10teams

Block-Angular Structure

- ▶ key to automatic decomposition: detect “structure”

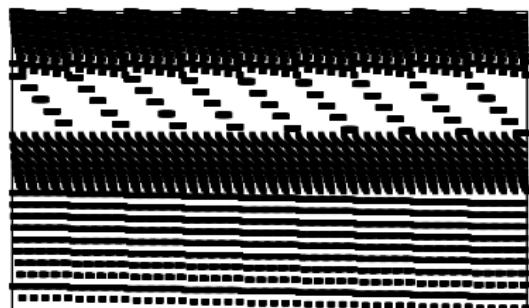

10teams

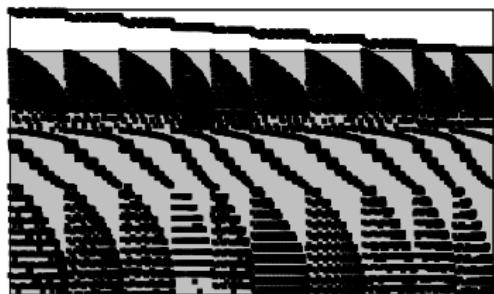

10teams

Block-Angular Structure

- ▶ key to automatic decomposition: detect “structure”

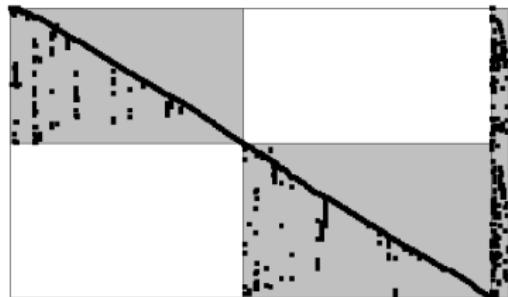

10teams

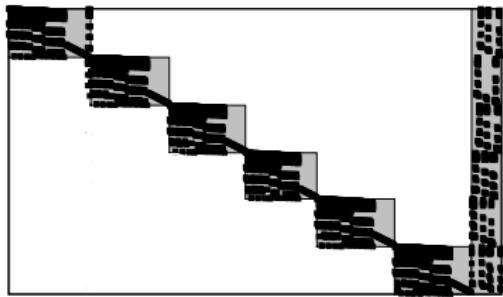

10teams

Often: Linking Variables

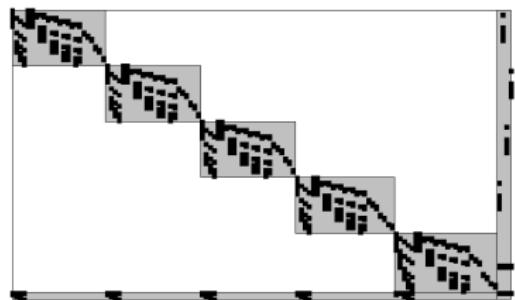

timtab1

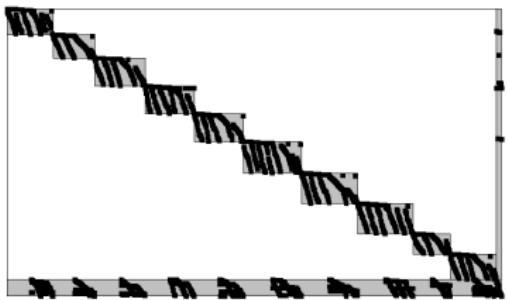

gesa2

- ▶ e.g., replace linking variable x by copies x^i , enforce $x = x^i$
- ▶ alternatively, use DW reformulation $x^i = \sum_{p \in P^i} \lambda_p p$

More General: Arrowhead Structure

noswot

aflow30a

Where do these Pictures come from?

Where do these Pictures come from?

- ▶ “folklore” connection: (hyper-)graphs and matrices
 - ▶ several possibilities, e.g., (variant of Ferris/Horn, 1998)
 - ▶ vertex for every non-zero entry
 - ▶ hyperedge for each row, resp. each column
 - ▶ (different weights for different types of vars and conss)

Where do these Pictures come from?

- ▶ “folklore” connection: (hyper-)graphs and matrices
 - ▶ several possibilities, e.g., (variant of Ferris/Horn, 1998)
 - ▶ vertex for every non-zero entry
 - ▶ hyperedge for each row, resp. each column
 - ▶ (different weights for different types of vars and conss)

$$\begin{pmatrix} 1 & 1 & & & 1 \\ & 1 & & & 1 \\ 1 & 1 & & & \\ & & 1 & & 1 \\ & & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 \end{pmatrix}$$

Where do these Pictures come from?

- ▶ “folklore” connection: (hyper-)graphs and matrices
 - ▶ several possibilities, e.g., (variant of Ferris/Horn, 1998)
 - ▶ vertex for every non-zero entry
 - ▶ hyperedge for each row, resp. each column
 - ▶ (different weights for different types of vars and conss)

$$\begin{pmatrix} 1 & 1 & & 1 \\ & 1 & & 1 \\ 1 & 1 & & \\ & 1 & & 1 \\ & & 1 & 1 \\ & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 \end{pmatrix}$$

Where do these Pictures come from?

What is a “good” Decomposition: Blocks

- ▶ influence of the number k of blocks on the “shape” (*fiber*)

What is a “good” Decomposition: Visual

- ▶ visual differences for different decompositions ($10\text{teams}, \text{rout}$)

Quality of a Decomposition

- ▶ caveat! don't think there is structure only b/c you see it
- ▶ a matrix can be permuted in many ways
- ▶ measure for the quality of a decomposition is needed
- ▶ this is a theoretically very challenging question
- ▶ here we used heuristic quality measures like "border area"

MIPLIBs: Instance Selection

Selected MIPLIB 2003 and 2010 instances for which

- ▶ the optimum is known
- ▶ the density is between 0.05% and 5%
- ▶ the number of non-zeros is not larger than 20,000
- ▶ the percentage of discrete variables is at least 20%

MIPLIB2003: Quality in Root Node

MIPLIBs: Computation Time

- # instances solved to integer optimality, SCIP vs. GCG

General IPs: These are the wrong Instances!

- ▶ we wish to exploit *structure* in IPs,
so we need to consider structured IPs!

General IPs: These are the wrong Instances!

- ▶ we wish to exploit *structure* in IPs,
so we need to consider structured IPs!
- ▶ to this end, we are currently building the **strIPlib**
- ▶ planned as a web portal as source of information and sandbox
- ▶ bin packing, cutting stock, vertex coloring, p -median,
generalized assignment, vehicle routing, machine scheduling,
your instances here, ...

General IPs: These are the wrong Instances!

- ▶ we wish to exploit *structure* in IPs,
so we need to consider structured IPs!
- ▶ to this end, we are currently building the **strIPlib**
- ▶ planned as a web portal as source of information and sandbox
- ▶ bin packing, cutting stock, vertex coloring, p -median,
generalized assignment, vehicle routing, machine scheduling,
your instances here, ...
- ▶ **rather small** subset for this talk:
 - ▶ all N1*, N2* instances from bison 1 binpacking set (360 instances)
 - ▶ selected instances from
 - ▶ GAP: orlibrary and Yagiura testset (16 instances)
 - ▶ cut. stock: Schwerin, Waescher and hard28 (12 instances)
 - ▶ cap. p -median: optlab and orlibrary (6 instances)
 - ▶ vertex coloring: r-set (4 instances)
 - ▶ criterion: solved in less than 600s, varying in nodes and size

Detecting Structure in Structured IPs

- ▶ application of hypergraph approach fails surprisingly often!

- ▶ # blocks for *gapa_3*: `hmetis`: 16, “natural/best”: 10

Detecting Structure in Structured IPs

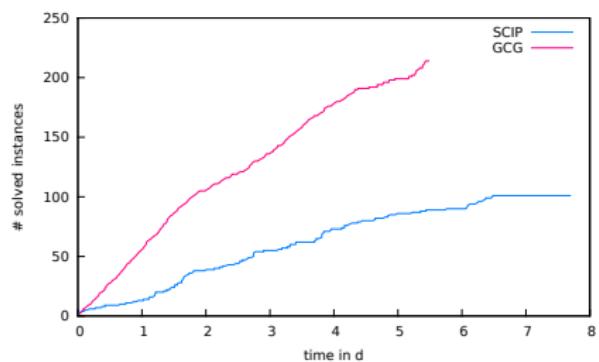

- ▶ better, easier, faster detection based on constraint types
e.g., SPP constraints → master, block detection on remainder

	blocks	hmetis nodes	time	blocks	best nodes	time
gapa_3	16	1	0.8	10	1	6.0
gapc_5	16	1217	57.8	20	27	6.8
N1C3W4_E	16	≈ 26k	5.41%	50	1	9.2
N1C3W4_L	16	≈ 25k	6.20%	50	22	14.3
out15-1	—	—	—	100	271	212.8
out18-1	—	—	—	100	503	264.9
R50_1g	9	1	47.5	9	6580	7.7
R75_1gb	13	1	411.6	13	10426	228.9
TEST0005	—	—	—	57	59	553.0
TEST0084	—	—	—	46	454	137.1

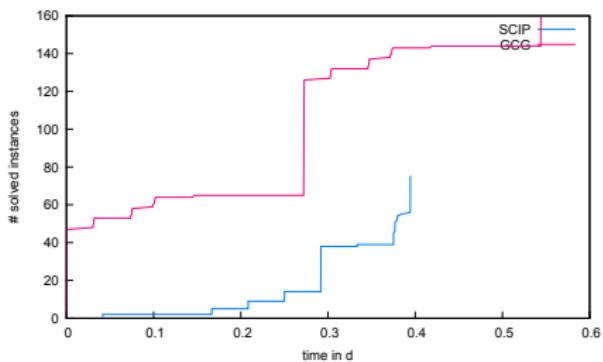

- ▶ ample room for (heuristic) improvements

Computation Times for Structured Problems

- # instances solved to integer optimality, GCG vs. SCIP

cutting stock

generalized assignment

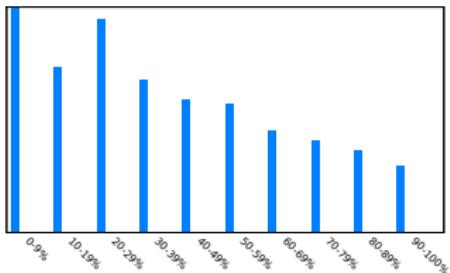

Benefits from this Approach

- ▶ use a *single* generic implementation on a large number of classical and non-classical applications
- ▶ collect all kinds of data and compare in unified way
- ▶ caveat!

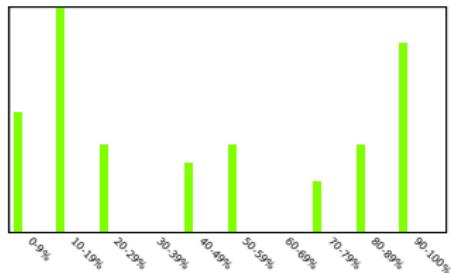

the following figures only serve the purpose of illustration!

When do we Generate the “Important Columns”?

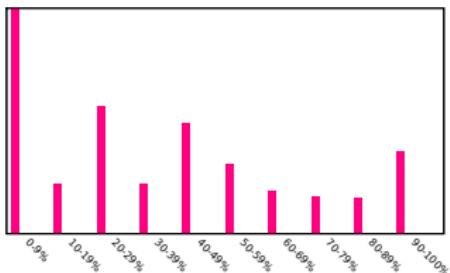

- columns that contribute to the best IP solution

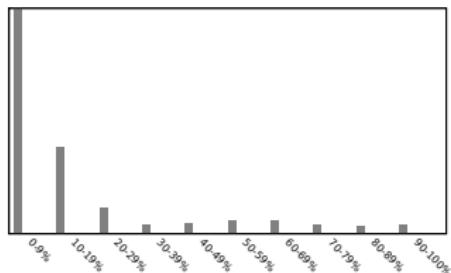

bin packing

vertex coloring

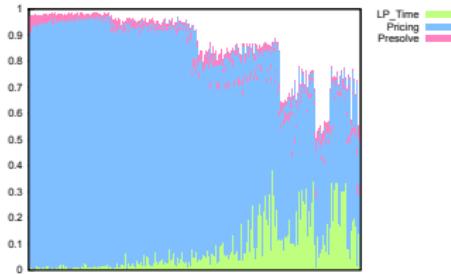

cutting stock

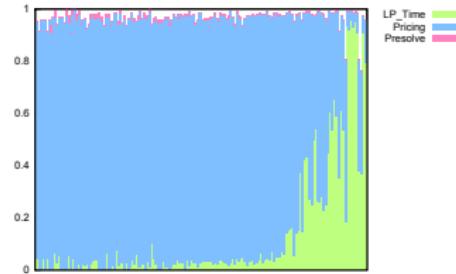

capacitated p -median

Where do we Spend the Computation Time?

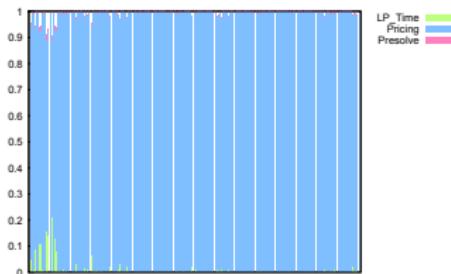

- instances sorted according to computation time

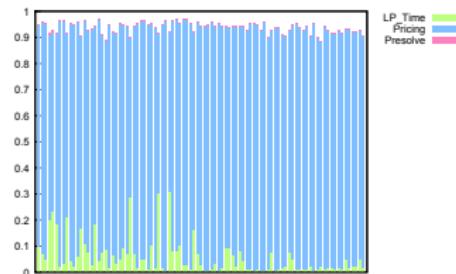

bin packing

generalized assignment

cutting stock

capacitated p -median
OPERATIONSRESEARCH RWTH AACHEN

Much more is Collected

- ▶ degree of degeneracy
- ▶ behavior of dual variables
- ▶ how do the primal/dual bounds develop in the tree
- ▶ which heuristics work well
- ▶ effectiveness of features like pseudo-costs, propagation, . . .
- ▶ pictures/statistics about different decompositions
- ⋮
- ▶ this information available about *your instance* via `strIPlib`

Benefits from Building on a State-of-the-Art Solver

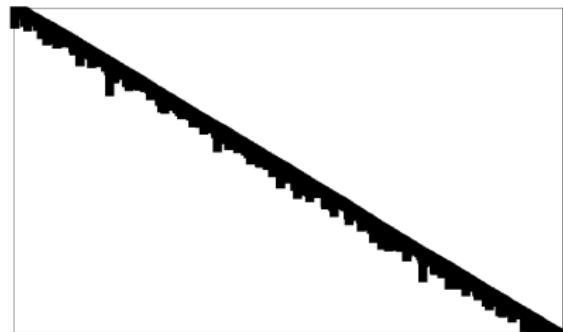

- e.g., presolve (-19% time) and cutting planes (-3% time)

	GCG default settings		no presolve		no cuts

Feature Request and Call for Instances

- ▶ if you were to use a generic BP&C solver:
what features would you like to see?
- ▶ if you like the solver to work well on your problems:
send us your instances!

Take-Home

- ▶ automatic decomposition and branch-price-and-cut doable
- ▶ lucky for “unstructured” IPs, successful on “structured”
- ▶ challenge: tell promising from unpromising instances
- ▶ ideally, this will complement existing state-of-the-art solvers

Take-Home

- ▶ automatic decomposition and branch-price-and-cut doable
- ▶ lucky for “unstructured” IPs, successful on “structured”
- ▶ challenge: tell promising from unpromising instances
- ▶ ideally, this will complement existing state-of-the-art solvers
- ▶ GCG 1.0 to be released within “SCIPoptsuite” at ISMP2012
- ▶ strIPlib will be made public for you to play (and learn)

Take-Home
